ABSTRACT

FlexSim is excited to unveil our brand-new healthcare simulation module at the Winter Simulation Conference! FlexSim Healthcare (HC) was released in 2009 and has helped numerous healthcare systems and facilities to model and analyze patient flow activities for the past decade, particularly in the areas of patient waiting time and staff/equipment utilization. Now, on the 10th anniversary of its release, we'll be showcasing its successor—a powerful, modern module that was designed to be even more capable, easy-to-use, and visually impressive. This version allows for even more granular control in modeling the specifics of complex healthcare systems without resorting to code, with myriad new features ranging from enhanced database connectivity to virtual reality, improved data and reporting to automated travel networks and much more.

Join us for a live demonstration of FlexSim's expanded capabilities for modeling and analyzing healthcare systems.
